

Activity 6: Build Your Own Screening Agent in Copilot Studio

Duration: 45 minutes **Roles:** Agent builder, then reviewer for another team

Scenario

Your company needs its own screening assistant grounded in its own hiring policy, not a generic chatbot.

Goal and output

A published agent with instructions, SharePoint knowledge and a tested refusal behaviour.

Tools and data boundary

Copilot Studio, environment TGS-2024051421-Generative AI for Interviewing | one company SharePoint site

Use only supplied de-identified training data. Do not enter live candidate data, employer-confidential information or production API keys.

Detailed step-by-step

Step 1

In Copilot Studio, open the course environment and choose New agent.

Step 2

Name it ' Screener' and write instructions using the four-part pattern.

Step 3

Write explicit fairness rules and an untrusted-content rule into the instructions.

Step 4

Add SharePoint knowledge: pick one of the five company sites and add its URL.

Step 5

Remove the default 'Search all websites' source so the agent answers only from tenant data, and explain why that matters.

Step 6

Save, then Publish, then test in Preview with a real screening request.

Step 7

Test the boundary: ask it to rank by a protected trait and confirm it refuses.

Step 8

Swap with another team and review their agent: find one instruction you would strengthen.

Evidence files

- agent_spec.txt

Recovery and troubleshooting

If the tool output is missing, generic, biased or ungrounded, preserve the input and output, mark the item as rejected, revise one constraint at a time, and regenerate. If access fails, use the supplied templates and local/demo mode; do not substitute live candidate data.

Completion criterion

A published agent with instructions, SharePoint knowledge and a tested refusal behaviour.
